

Dear Editor-in-Chief,

We are writing to resubmit our revised manuscript, titled "High-Throughput and Low-Latency DrDoS Detection Using Quantized ONNX Models", for your consideration for publication in *Symmetry*. We have carefully considered the constructive feedback from the reviewers and the editor, and we have made substantial revisions to address all comments and improve the scientific rigor of our work.

We believe the revised manuscript is significantly stronger, offering enhanced empirical depth and clarity. The main revisions are detailed below:

- To evaluate the generalizability of our deployment pipeline, we expanded our framework to include two additional structurally distinct deep learning baselines: a 1D Convolutional Neural Network (1D-CNN) and a Gated Recurrent Unit (GRU) network. This allows for an objective end-to-end comparison.
- We have conducted extensive benchmarking across different batch configurations. This analysis systematically decouples the latency reduction contributions of ONNX runtime compilation, dynamic quantization, and static quantization.
- We have increased our experimental execution iterations from 30 to 100 runs to capture standard deviations and perform statistical significance testing ensuring highly stable and reliable latency profiles.
- We have clarified our preprocessing pipeline in Section 4. We detail the acquisition of 113,828 benign samples from the official CIC-DDoS-2019 dataset.
- We have documented exact software dependency versions and random seeds in the Supplementary Materials and integrated a formal Data and Code Availability Statement.
- The entire manuscript has undergone a rigorous copy-editing and proofreading process by a native English speaker. We have corrected all typographical errors, simplified overly complex sentences, and standardized key terminologies throughout the text.
- In accordance with the MDPI disclosure policies, we have declared our commercial funding source and updated the Conflict-of-Interest section using the journal's recommended phrasing.
- As requested by the Editorial Board, we have updated both our Abstract and Introduction to explicitly contextualize how our methodologies correlate with symmetry.

We confirm that neither the manuscript nor any parts of its content are currently under consideration for publication with or published in another journal. All authors have approved the manuscript and agree with its submission to *Symmetry*.

We trust that these comprehensive revisions have fully addressed the concerns raised and that the manuscript is now suitable for publication in *Symmetry*. Thank you for your time and continued consideration.

Sincerely,

İlker Özçelik, PhD
